Federal Flood Risk Management Standard

Transportation and Flood Risk

Flood risks impact our environment, economic prosperity, public health, and safety. Floods can lead to damaged roads, bridges, rail systems, and other transportation infrastructure, and threaten the long-term investments that Federal, State, and local governments are making in transportation infrastructure. Flooding may also result in disrupted transit service or closed roads, potentially limiting access to key evacuation routes during extreme weather events. Climate change is expected to continue to have significant impacts on current and future flood risks, with associated increases in flood damages and risk to human life in many areas of the United States.

To protect the integrity of the nation's transportation system and the people it serves, it is essential to manage and reduce flood risk when taking actions to plan, design, maintain, and repair our transportation system. Investments in resilience result in cost savings over time, through reduced repair costs, reduction of repetitive and substantial damages, improved safety, and reduced travel disruption.

The Bipartisan Infrastructure Law defines resilience as:

... a project with the ability to anticipate, prepare for, or adapt to conditions or withstand, respond to, or recover rapidly from disruptions, including the ability--

(A)(i) to resist hazards or withstand impacts from weather events and natural disasters; or (ii) to reduce the magnitude or duration of impacts of a disruptive weather event or natural disaster on a project; and

(B) to have the absorptive capacity, adaptive capacity, and recoverability to decrease project vulnerability to weather events or other natural disasters.

For the full definition, see sec. 11103 of the Bipartisan Infrastructure Law (BIL), enacted as the Infrastructure Investment and Jobs Act, Pub. L. 117-58 (Nov. 15, 2021).

Federal Flood Risk Management Standard

Executive Order 13690 issued on January 30, 2015, established a Federal Flood Risk Management Standard (FFRMS) to incorporate the most recent climate science into planning, National Environmental Policy Act (NEPA) procedures, and other processes for all federally funded actions.

E.O. 13690 modified and built upon the 1977 E.O. 11988 "Floodplain Management," adding new elements such as the application of nature-based solutions, redefining the base floodplain to account for climate conditions, and adding new definitions, exceptions, and requirements. E.O. 13690 was revoked but then reinstated by E.O. 13690, which reestablished the FFRMS.

“It is the policy of the United States to improve the resilience of communities and federal assets against the impacts of flooding. These impacts are anticipated to increase over time due to the effects of climate change and other threats. Losses caused by flooding affect the environment, our economic prosperity, and public health and safety, each of which affects our national security.”

- Section 1 of Executive Order 13690

FFRMS Interim Guidelines

[FFRMS Interim Guidelines](#)

The FFRMS requires the Department of Transportation to establish the FFRMS floodplain using one of the following approaches:

- 1. Climate-informed Science Approach (CISA).** The elevation and flood hazard area (i.e., geographic extent of the elevation’s corresponding floodplain) that results from using a climate-informed science approach that uses the best-available, actionable hydrologic and hydraulic data and methods that integrate current and future changes in flooding based on climate science. This approach will also include an emphasis on whether the action is a critical action as one of the factors to be considered when conducting the analysis.
- 2. Freeboard Value Approach (FVA).** The elevation and flood hazard area that results from adding an additional 2 feet to the Base Flood Elevation (BFE) and expanding to the corresponding horizontal extent for non-critical actions, and by adding an additional 3 feet to the BFE and expanding to the corresponding horizontal extent for critical actions.
- 3. 0.2-Percent-annual-chance Flood Approach (0.2PFA)** The area subject to flooding by the 0.2 percent annual chance flood (also known as the 500-year flood).

Consistent with USDOT’s support for incorporating future climate risk exposure within our overall programs, USDOT prefers the CISA to establish the FFRMS floodplain when data to support such an analysis is available.

USDOT has developed the set of actions described in its Interim Guidelines to implement the FFRMS within our floodplain management authorities, actions, and applications. These [Interim Guidelines](#) are available for review and comment through the Federal eRulemaking Portal: <http://www.regulations.gov>.

USDOT has existing flood risk resources in place to advance the goals of the FFRMS and assist sponsors of USDOT-funded actions in establishing the FFRMS floodplain. These resources and tools, combined with existing floodplain regulations, provide options on the many opportunities to build resilience to flooding into the planning and construction of transportation projects.
